

# Deploying Your First Tool: Universe

## 1. Welcome to the Universe

The Universe script doesn't just send you quotes.

It sends you truths — rare facts, hidden patterns, and secrets you won't find in some recycled Instagram feed.

Every hour, your phone lights up with a ping from the cosmos — right on your notification bar.

No app. No ads. No noise. Just pure signal.

## 2. Why This Matters

- You're installing your first script into Termux — our command center.
- You're seeing automation work in real-time.
- You're bridging into a skillset most people never touch.

By the time the first quote hits, you're already ahead of 90% of people who've never run a script in their life.

## 3. How to Deploy (It's Stupid Simple)

1. Install Termux – If you haven't, grab it from F-Droid (use Drop guide).

2. Clone the Repo:

```
git clone https://github.com/LatensTech/universe
cd universe
```

3. Run the Installer:

```
bash install.sh
```

That's it. The rest is automatic.

## 4. What Happens Next

- Every hour: A fresh Secret from the Universe hits your notifications.
- All quotes are stored locally — no internet dependency once installed.
- You can edit the quotes file, add your own, or replace it entirely (Guide Provided).

## 5. Your First Taste of Power

This is more than a novelty. You've just:

- Installed and configured a tool in Termux.
- Experienced the magic of automation, python and code.
- Stepped into the flow of the Latens Potentia network.

Now imagine what happens when the next drops connect together.

**Latens Potentia Systems – Once you open the door, the Universe walks in.**
